

# CONNECT

## Essential Wireless

A dependable service designed to meet the diverse connectivity needs of any organisation. Essential Wireless provides the fundamental bandwidth required for efficient functionality of services such as VoIP, Mail and the Cloud.

While Essential Wireless also imitates the powerful characteristics of fibre, this product suite is tailored for organisations that require dependable connectivity, but have less stringent bandwidth and SLA requirements. This product can also be deployed in either a primary or redundant state or even for shorter periods where customers are awaiting fibre deployments.

Our highly redundant, reliable network is built on carrier-grade CISCO Core equipment and is also backed by the latest Lithium technology. Our network is geared to ensure the availability of services during extreme stages of load-shedding. If your organisation requires dependable SLA's, scalability and peace of mind, Essential Wireless is for you!

	<b>Essential Wireless Plus</b>	<b>Essential Wireless</b>
